

Software Engineering

Minimum things we need to prove our software is successful. (success means how many people are using it for how long)

Project = Process * technology * tools * culture (so decide which one to make zero to fail the project.)

Base rules

1. Focus on the project success.
2. No judgements on any team members.
3. Process tailored to size of the team and style of the customer.
4. Zero Emotions on the code, working to next, not working, think what to change.

Process

1. Requirements
 - a. Details
 - b. Priority
 - c. What will change, what will not change
 - d. Acceptance criteria.
2. Design
 - a. Architecture
 - b. Traceability matrix
 - c. Low level design *****
 - d. Test cases
 - e. Integration and Implementation Details
3. Coding
 - a. Test cases
 - b. Know the language and best practices
 - c. Unit Testing
 - d. Test report
4. Testing
 - a. Depends on project profile
 - b. Too many, but decide
5. Implementation
 - a. Homo Sapiens issues

6. Maintenance

- a. Know what changes ,
- b. Isolate it
- c. Configure instead of code
- d. Hot deploy design.

Parallel things very important

1. Documentation Make things formal
2. Reviews -- Ask feedback
3. Quality Assurance – data collection and valuing consistency.
4. Risk Management – nobody has been killed because of doing this aggressively.
5. Change Control – control changes in an organized way
6. Project Management – Culture is important, task dependencies, making WBS structures, key thing is details.
